Ford Fiesta - 2008

Q1: Can I use and EZshim to adjust rear camber and toe?

A1: Unfortunately, no, the position of the ABS sensor on the rear hub prevents the use of a shim. Installing a shim would pull the sensor away from the rotating hub ring and cause an ABS fault.

Q2: How is front camber adjusted?

A2: The only way front camber can be adjusted is by installing the part number 81250 EZCam. This will allow up to plus or minus 1.75 degrees of change.
