

Specialty Products **FAQ**

Part numbers 28810/28815

Application Information and Fitment

Q1: The 28810 and 28815 kits look very similar. What are the differences in application and fitment for these two kits?

A1: These kits are used on many Mercedes Benz and Chrysler vehicles. There are different configurations of frame brackets and bushings depending on the application. The 28815 bolt has a single groove cut in it and comes with a special washer that will fit the frame bracket after installation. This holds the hardware in place. The 28810 bolt has two grooves in it to fit a specific style of frame bracket or bushing. In some applications, the bolt hole in the frame bracket is a simple round hole but the bushing in the control arm is elongated with ridges to accept the grooves in the bolt.

Q2: Can I get more change than the stated +/- .3 degree?

A2: Unfortunately, not with this kit. As with many other kits, the amount of change is limited by the opening in the frame bracket.
